The latest evolution in the award-winning 8600 thermal dye printer line is the KODAK PROFESSIONAL 8660 Thermal Printer. The 8660 Thermal Printer is a new raster-based printer that combines the features and color management technology of the KODAK PROFESSIONAL 8670 PS Thermal Printer with a new robust engine design. It promises to be the premier page size photo printer on the market. Its fast processing means increased productivity. And simplified color management provides users with an easy-to-use solution to achieve consistent high-quality color-right images.

The 8660 Thermal Printer uses KODAK Thermal Media, delivering the same high-quality output that you have built your reputation on. Durable image stability means prints will last as long as traditional photographic prints. You'll get waterfast prints that are light fade resistant, fingerprint resistant, and re-transfer protective. Multiple output sizes are available: 5 x 7 inches; A4; 8.5 X 11, 12, and 14 inches. Built-in layout template provides a broad range of new formats on a single sheet, or customize your own layout design if you like.

The 8660 printer also includes auto detection of memory, and offers an optional 10/100 Mb Network Interface Card, resulting in easy setup and printer installations. Robust feature set, versatile connectivity options, and an XAPI Toolkit (available to DRG members) provide attractive print options for integrated solutions, offering customers innovative ways to deliver images.

Simplified Color Management

The 8660 printer produces accurate, consistent color resulting from embedded KODAK Color Management Technology. The secret behind the color accuracy starts with Kodak's new innovative COLORFLOW ICC Color Connector application which drastically simplifies the color management process.

If you do wish to use color management, you can install the KODAK PROFESSIONAL COLORFLOW ICC Color Connector Software (included with the printer) on your computer. The color connector application allows you to make prints that match the colors produced by input devices such as scanners or monitors. You can also simulate a job as if it were printed on a commercial printing press. How? By combining industry-standard ICC transforms to create color connector files which contain color management information specific to the device you are using, such as scanner, digital camera, monitor, and output devices.
